Product Design End to end product design · Service design · Information architecture · Interaction design · Design systems · Visual design · Prototyping · Accessibility (WCAG)

Research & Product User research and interviews · A/B testing · Heatmap and session analysis · Conversion optimization · Cross functional collaboration · Product strategy

AI & Design Tools Figma · Claude Code · Cursor · Framer · Figma Make · shadcn/Tailwind · Front end development (React, Vue)

Language English · Mandarin

Solo designer for an AI native deep tech research platform, working with a five engineer team.

- Led end to end design of Deeli's conversational AI chatbot for enterprise research: intent detection through proactive clarifying questions that capture what users mean instead of matching keywords. Defined the AI guardrails with engineers and validated the flows through user research. **Results:** Natural language query share rose from 13% to 70%; average queries per active day rose roughly 220% from internal pilot to launch week 2.
- Built an automated user research to evaluation pipeline: AI agents synthesize hundreds of support tickets and interview transcripts into updated personas and automated test scenarios the model must pass weekly. The evals revealed that mixed language (English/Mandarin) queries made the chatbot answer in the wrong language, so I designed a language confirmation step with ML engineers. **Results:** Research synthesis cut from 6+ hours to about one per week.
- Built the product design system from the ground up, from token architecture to WCAG compliant components, and wrote a design spec (design.md) plus an AI assisted prototyping workflow (Claude Code, Cursor) that lets PMs and teammates self serve near production prototypes without a designer in the loop. **Results:** Brand and component turnaround cut from one week to under a day; design QA time cut 50%.
- Designed the trust layer that lets researchers verify AI generated answers themselves instead of escalating: citations, source counts, confidence signals, conflicting source flags, and drill down paths to sources. The same patterns now anchor the team's emerging AI features. **Results:** Events per session grew from 3 to 10+; time to report cut 50%.

Data Monitor Team

- Built a 0 to 1 device monitoring and troubleshooting tool at Swiftly, a transit data platform serving 190+ agencies across the US and EU, leading discovery research, information architecture, and shipped UI inside a five person cross functional team (PM, TPM, engineering). **Results:** Device investigation time cut from 30+ hours to 12 to 24 hours; device-issue inbound to the internal support team down 20%.
- Shifted the team from engineering led to design led, mapping the service end to end and running design reviews that pulled engineering, product, and customer success into design decisions before build.

News Analytics Team

- Redesigned the news analytics experience for over one million board leaders in governance, risk, and compliance, using user research and A/B testing to drive adoption of a data-heavy product. **Results:** Click through rate up 300%; average session duration up 15%.

Internal Maintenance Product Team

- Led service design unifying fragmented IT, finance, and maintenance workflows for 50,000 campus users, mapping the end to end service journey, adding NLP that parsed each request to detect what service the user needed, and shipping an iPad field app with real time updates and offline support. **Results:** Service turnaround cut 33%.

Design and Analytics Team

- Shipped product designs for Fortune 500 clients including Sony and CDK Global, translating user research into information architecture, user journeys, and tested prototypes.
